

Module 2 Submission

Team Name: Mexico City

Your Stakeholders and their JTBD:

For each stakeholder, please provide a short description outlining who they are (e.g., company, position, role) and clearly define their respective Jobs To Be Done (JTBD).

1. Stakeholder: Hausverwaltungen / Property Management Firms

Description:

Hausverwaltungen are the primary customers of our solution. They manage residential and commercial properties on behalf of owners and are responsible for maintenance coordination, financial administration, legal documentation, reporting, owner communication, and (depending on the type of management) tenant communication.

Our interviews showed that the work of Hausverwaltungen is highly operational: many tasks are triggered by unexpected issues such as broken heating systems, internet problems, water damage, invoices, or urgent coordination with service providers. One interviewee estimated that around 60% of the work is operational rather than fully plannable. Many processes are still fragmented across phone calls, emails, WhatsApp, paper folders, and legacy software.

JTBD:

When I manage multiple properties, repair cases, owners, service providers, invoices, and legal deadlines at the same time,

I want to reduce manual coordination, structure incoming requests, and automate repetitive administrative tasks without replacing my existing core software,

so that I can save time, avoid errors, stay legally compliant, and provide reliable service to owners, tenants, and external partners.

2. Stakeholder: Tenants / Renters

Description:

Tenants are end users affected by the quality of property management, especially in rental management. They contact the Hausverwaltung or their landlord when they face problems such as heating issues, internet/TV outages, water damage, utility questions, or building-related concerns.

However, the interviews showed an important distinction: in WEG management, tenants are often not the direct contact of the Hausverwaltung. Instead, they usually need to contact their landlord first, who then communicates with the Hausverwaltung. This means tenants are still affected by property management quality, but they are not always direct users of the system.

JTBD:

When I have a problem in my apartment or need information about a building-related issue,

I want to report the issue easily, provide relevant information such as photos or location, and understand who is responsible for the next step,
so that my problem is handled quickly and I do not have to repeatedly call or write messages without knowing what is happening.

3. Stakeholder: Property Owners / Landlords / WEG Boards

Description:

Property owners, landlords, and WEG boards are central stakeholders because they own the properties, approve decisions, pay for management services, and expect legally correct administration. In WEG management, they are usually the primary contact for the Hausverwaltung, not the tenants.

They depend on transparent reporting, accurate annual statements, correct allocation of costs, documentation of repairs, and reliable communication about larger expenses. The interviews also showed that the Beirat or ownership group may need to approve costs above certain thresholds, and that Eigentümerversammlungen can become time-consuming and difficult when discussions become emotional or unstructured.

JTBD:

When I own or co-own a property that is managed by a Hausverwaltung,
I want to receive transparent information about costs, repairs, invoices, decisions, and legal obligations,
so that I can make informed decisions, protect the value of my property, and trust that the management is acting correctly and efficiently.

4. Stakeholder: Maintenance Providers / Handwerker / Facility Service Providers

Description:

Maintenance providers are external companies or individuals who perform repairs, inspections, cleaning, heating service, technical maintenance, or larger renovation work. They are essential for resolving operational issues.

The interviews showed that reliable service providers are highly valuable, even if they are slightly more expensive, because fast response times matter in urgent cases. Repair coordination often involves several steps: receiving the issue, contacting the right provider, checking the problem, collecting photos or cost estimates, getting approval if necessary, and later checking the invoice against the offer.

JTBD:

When I receive a repair, maintenance, or inspection request from a Hausverwaltung,
I want to get complete information, a clear description, photos, access details, urgency level, and approval status,
so that I can assess the issue quickly, avoid unnecessary back-and-forth communication, and complete the job efficiently.

5. Stakeholder: Public Authorities / Utility Providers / Municipal Services

Description:

Public authorities, municipal services, utility providers, and similar institutions are external stakeholders that Hausverwaltungen regularly depend on. This includes, for example, city utilities, water and energy providers, tax-related institutions, or administrative bodies.

The interviews revealed that communication with authorities and utility providers can be a major pain point. For example, outdated contact records or unclear responsibilities can lead to wrong invoices, reminders, and unnecessary administrative work. Unlike tradespeople or service providers, who often respond quickly because they want to be paid, public institutions were described as slow and difficult to move forward.

JTBD:

When a property, ownership structure, billing address, management responsibility, or legal/administrative status changes,

I want to process complete, correct, and clearly structured information from the Hausverwaltung,

so that records, invoices, taxes, and service responsibilities can be updated accurately and unnecessary reminders, wrong bills, or administrative delays are avoided.

Your Empathy Research in Pictures & Quotes:

Min. three pictures, that show how you did interviews/observation/immersions. Also, add min. three quotes that stuck with you (because they were surprising/contradictory/funny etc).

Interview 1:

The interview was conducted in person using a semi-structured interview guideline. During the conversation, we focused on daily workflows, communication channels, repair coordination, software usage, and major pain points in property management.

Quote 1:

“The operational business is around 60%.”

Why it stuck with us:

This quote showed that Hausverwaltungen do not only manage planned administrative tasks. A large share of the work is reactive and driven by unexpected problems, such as repairs, calls, or coordination tasks.

Quote 2:

“The biggest time loss in communication happens on the phone.”

Why it stuck with us:

This quote highlighted that phone calls are not just a communication channel, but a real interruption factor. Calls often arrive unstructured, sometimes outside working hours, and force the Hausverwaltung to stop other tasks.

Quote 3:

“My current system is significantly more cumbersome, but additional digital modules do not pay off for only a few properties.”

Why it stuck with us:

This quote revealed a contradiction: digitalization would make work easier, but for small property managers, expensive software modules may not be economically attractive.

Quote 4:

“Communication with authorities is my current pain point.”

Why it stuck with us:

This was surprising because we initially focused mainly on tenants, owners, and maintenance providers. The interviews showed that authorities and utility providers can create major administrative friction.

Quote 5:

“Owner meetings are often extremely exhausting.”

Why it stuck with us:

This quote showed that not all pain points are purely technical. Some challenges are social and organizational, such as managing discussions, conflicts, and decision-making among owners.

Interview 2:

The interview was conducted online with an international student currently renting a private apartment in Munich. The discussion mainly explored communication with landlords and property management, maintenance request experiences, language barriers, and how tenants currently keep track of apartment issues.

Quote 1:

"I basically heard nothing for almost a week."

Why it stuck with us:

This quote showed how stressful maintenance issues can become when tenants receive no response or confirmation after reporting a problem.

Quote 2:

"I kept checking my inbox and eventually sent follow-up emails."

Why it stuck with us:

This highlighted how tenants currently rely on scattered emails and repeated follow-ups just to understand whether their issue is being handled.

Quote 3:

"There's no place where I can see my requests or the maintenance progress."

Why it stuck with us:

This quote revealed a lack of centralized visibility in the current process. Tenants often cannot track repair status, timelines, or responsibilities in one place.

Quote 4:

"I don't know whether I should contact the landlord directly, the apartment management, or some external technician."

Why it stuck with us:

This showed how confusing the housing system can feel, especially for international students who are unfamiliar with local processes and communication structures.

Quote 5:

"I don't necessarily expect everything to be fixed right away, but I just want visibility into what's happening."

Why it stuck with us:

This quote made us realize that transparency itself is a major need. Even simple updates or status tracking could reduce uncertainty and improve the tenant experience significantly.

Interview 3:

The interview was conducted in person with a university student currently living in a shared apartment in Munich. The discussion was mostly based on the arrangement of larger maintenance and renovation periods between tenants and landlords, and the lack of communication & lack of alternative options.

Quote 1:

“We were left without a place to stay for 3 weeks with barely any notice”

Why it stuck with us:

This was quite surprising, and the leading point into the interview. The landlord of the interviewee's shared apartment unexpectedly scheduled an extensive bathroom renovation requiring the apartment to be vacated for three weeks. Although the tenants aren't obliged to pay rent during this period, they do need to find a place to stay, being costly and inconvenient. This showed how impactful maintenance/renovation decisions are to tenants.

Quote 2:

“We were out of the loop for the decision process of the renovation to begin with”

Why it stuck with us:

The renovation of the bathroom was, according to the interviewee, not necessary, despite the inconvenience for the tenants and cost to the landlord; and the tenants were unhappy that they were left completely out of the loop.

This showed that being informed well about not just the maintenance periods, but also the decisions being made is important for the tenants.

Quote 3:

“The landlord is now spending so much into renovation, while he didn’t lift a finger for months when we told him weekly that the kitchen sink was leaking”

Why it stuck with us:

This showed that being aware of the tenants’ smaller needs for the maintenance of the house is more important for a better management, and not waste tons of money on a change that won’t affect the quality of life of the tenants or give any return to the landlord or Hausverwaltung.

Quote 4:

“One of my flatmates has already started looking for a completely new place”

Why it stuck with us:

This quote showed the direct impact of the lack of communication between the landlord and the tenants, resulting in one tenant looking for different place to stay, beyond the 3 week down time, resulting in a quite likely loss of a client.

Core Problems as POV statements:

After conducting your empathy research and synthesizing your findings, which patterns emerged? Translate these insights into clear POV statements from the perspective of the affected stakeholders (min. 2). "[Stakeholder] needs a way to ____ because ____."

1. Hausverwaltungen

Hausverwaltungen need a way to structure incoming requests, repair cases, invoices, and communication across different channels because their daily work is highly fragmented, reactive, and interrupted by phone calls, emails, WhatsApp messages, and paper-based processes.

2. Tenants / Renters

Tenants need a clear and transparent way to report and track apartment or building-related issues because they often do not know who is responsible, what information is needed, whether their request has been received, what the current repair status is, or what decisions are being made without their knowledge.

3. Property Owners / Landlords / WEG Boards

Property owners and WEG boards need a way to receive transparent, legally reliable, and decision-ready information because they must approve costs, understand repairs, check annual statements, and protect the long-term value of their property.

4. Maintenance Providers

Maintenance providers need a way to receive complete, structured, and pre-qualified repair information because missing details, unclear responsibilities, or delayed approvals create unnecessary back-and-forth communication and slow down repairs.

5. Small and Medium-Sized Hausverwaltungen

Small and medium-sized Hausverwaltungen need a way to access affordable automation on a per-unit or modular basis because high fixed software costs often do not pay off when only a limited number of properties or units are managed.

6. Hausverwaltungen + Existing Software Systems

Hausverwaltungen need a way to add digital or AI-based support without replacing their existing core software because switching systems requires long onboarding, reduces short-term productivity, and may not be economically viable for smaller property managers.

7. Hausverwaltungen + Owner Meetings

Hausverwaltungen need a way to prepare, structure, and document owner meetings more efficiently because Eigentümerversammlungen can become long, emotional, and difficult to manage when multiple owners discuss complex property issues.
